

“What often happens is that the patient is referred to the hospital to have a blood clot ruled out for leg pain or swelling using an ultrasound exam; the patient may be happy to find out they don’t have a blood clot, but usually there was no step taken to check for leaky valves. Therefore, the condition is missed, but the patient continues to live with discomfort or swelling.

“If they come to a facility like ours,” he continues, “they would receive comprehensive care to assure that they receive the right care from the start.”

Before

After*

Treatment can provide relief from the visible symptoms of venous insufficiency, as well as the physical discomfort and swelling.

Solving the Problem

In 2019, Dr. Shah joined the Center for Vein Restoration, a nationally recognized leader in the treatment of varicose and spider veins, with more than 75 locations and growing. The Center for Vein Restoration’s mission: “To improve lives in the communities we serve by providing state-of-the-art vascular care in a compassionate and affordable manner.”

Depending on the location, size, and position of the vein, as well as the patient’s lifestyle, Dr. Shah can choose from a number

of modalities to treat patients effectively. These minimally invasive procedures, which enable patients to walk in and out of the office and then return to work the next day, include: radiofrequency or laser ablation, which delivers uniform heat as a way to collapse the target vein; Varithena, an ultrasound-guided injectable microfoam that fills and treats the desired section of the target vein; and VenaSeal, a proprietary medical adhesive used to close the target vein by sealing it shut. For cosmetic spider veins, Dr. Shah uses sclerotherapy with a cold-air machine, or cryo-sclerotherapy, which makes it virtually painless.

When applicable, Dr. Shah may recommend a micro-phlebectomy, a minimally invasive procedure often done in tandem with laser or RF ablation, to treat the residual bulging varicose veins, which Dr. Shah calls “the tip of the iceberg.” The same veins will not come back after treatment, he adds. In addition, he often prescribes certain lifestyle changes, such as weight control, exercise, and the use of compression stockings. Because varicose veins with symptoms and treatment are considered medically indicated, they are covered by insurance.

“I wouldn’t wish varicose veins on anyone, but people should know that the condition is not something they have to live with,” says Bernadette Wasmer, a Telford resident who has been a patient of Dr. Shah’s for several years. “Dr. Shah has all kinds of procedures he can do to solve the problem. Some of the treatments sound as though they will be very painful, but you never feel more than a pinch. He has the magic, so you know he must love what he does.”

This level of care and attention to detail is what another longtime patient, Nora Martini, appreciates most about Dr. Shah. The West Chester resident describes Dr. Shah as a “trustworthy, professional, and caring doctor with

a terrific staff.” Over the past 15 years, Martini has relied on him to treat her varicose veins using modalities such as heat ablation and ultrasound-guided Varithena. In the near future, she will visit his office for a micro-phlebectomy to treat a remaining varicose vein.

“Dr. Shah has made the condition manageable,” Martini says. “I’ve been going to him for so long, and I feel so comfortable going there. I plan on being a patient of his for as long as he practices.”

While women are at the greatest risk of developing vein disease, men are hardly immune—as West Chester resident Kevin Donovan* can attest. Donovan was born with Klippel-Trenaunay syndrome, a rare congenital disorder characterized by venous abnormalities, among other symptoms. He has been a patient of Dr. Shah’s for more than eight years.

“I had gone to a number of doctors, and every one said I couldn’t do anything about it,” says Donovan, now in his early 40s. “In addition to varicose veins, I’ve had a constant aching and heaviness in my right leg, but Dr. Shah has done a few procedures that have helped me feel better. He makes each procedure as painless as possible. Now I’m back to see him every six months or so.”

As a result, Donovan says his quality of life has improved greatly. The discomfort has subsided, and he no longer worries about the aesthetic concerns that dogged him for too long. Whereas he used to be self-conscious about wearing shorts or otherwise exposing his affected leg, he says Dr. Shah’s treatment has made it so “you can’t really tell that I have a problem.”

In other words, Dr. Shah and the Center for Vein Restoration have enabled patients of all ages and backgrounds to “look better, feel better, and live better.”

“Varicose veins are unsightly, and that’s a huge consideration for a lot of people, but what’s most important is what happens down the road as people age,” adds Rodgers, Dr. Shah’s longtime patient from Paoli. “You don’t want to get to the point where you’re putting your health at risk.”

She remembers all too clearly the unfortunate progression of her grandfather’s vein disease. After years of going without adequate treatment, he had open ulcers on his legs.

“The treatments that Dr. Shah provides make all the difference, in terms of how you look and how you feel,” she says. “Besides that, he’s very calm and gentle, and he has a great sense of humor. If I didn’t like Dr. Shah and have faith in his abilities, I wouldn’t have been a patient of his for 25 years.” ■

Dr. Shah offers a number of minimally invasive procedures that enable patients to walk in and out of the office and then return to work the next day.
